# Conservation Partners Legacy Grant Program Phase VIII: Statewide and Metro Habitat Laws of Minnesota 2016 Final Report

# **General Information**

Date: 08/02/2025

Project Title: Conservation Partners Legacy Grant Program Phase VIII: Statewide and Metro Habitat

Funds Recommended: \$7,438,000

Legislative Citation: ML 2016, Ch. 172, Art. 1, Sec. 2, Subd. 5(k)

**Appropriation Language:** \$7,438,000 the second year is to the commissioner of natural resources for a program to provide competitive, matching grants of up to \$400,000 to local, regional, state, and national organizations for enhancing, restoring, or protecting forests, wetlands, prairies, or habitat for fish, game, or wildlife in Minnesota. Of this amount, up to \$2,500,000 is for grants in the seven-county metropolitan area and cities with a population of 50,000 or greater. Grants shall not be made for activities required to fulfill the duties of owners of lands subject to conservation easements. Grants shall not be made from the appropriation in this paragraph for projects that have a total project cost exceeding \$575,000. Of the total appropriation, \$588,000 may be spent for personnel costs and other direct and necessary administrative costs. Grantees may acquire land or interests in land. Easements must be permanent. Grants may not be used to establish easement stewardship accounts. Land acquired in fee must be open to hunting and fishing during the open season unless otherwise provided by law. The program must require a match of at least ten percent from nonstate sources for all grants. The match may be cash or in-kind resources. For grant applications of \$25,000 or less, the commissioner shall provide a separate, simplified application process. Subject to Minnesota Statutes, the commissioner of natural resources shall, when evaluating projects of equal value, give priority to organizations that have a history of receiving or a charter to receive private contributions for local conservation or habitat projects. If acquiring land in fee or a conservation easement, priority must be given to projects associated with or within one mile of existing wildlife management areas under Minnesota Statutes, section 86A.05, subdivision 8; scientific and natural areas under Minnesota Statutes, sections 84.033 and 86A.05, subdivision 5; or aquatic management areas under Minnesota Statutes, sections 86A.05, subdivision 14, and 97C.02. All restoration or enhancement projects must be on land permanently protected by a permanent covenant ensuring perpetual maintenance and protection of restored and enhanced habitat, by a conservation easement, by public ownership, or in public waters as defined in Minnesota Statutes, section 103G.005, subdivision 15. Priority must be given to restoration and enhancement projects on public lands. Minnesota Statutes, section 97A.056, subdivision 13, applies to grants awarded under this paragraph. This appropriation is available until June 30, 2020. No less than five percent of the amount of each grant must be held back from reimbursement until the grant recipient has completed a grant accomplishment report by the deadline and in the form prescribed by and satisfactory to the Lessard-Sams Outdoor Heritage Council. The commissioner shall provide notice of the grant program in the game and fish law summary prepared under Minnesota Statutes, section 97A.051, subdivision 2.

## **Manager Information**

Manager's Name: Kathy Varble Title: CPL Program Coordinator Organization: MN DNR Address: 500 Lafayette Road Box 20 City: St. Paul, MN 55155 Email: kathy.varble@state.mn.us Office Number: 651-259-5216 Mobile Number: Fax Number: Website:

## **Location Information**

**County Location(s):** Martin, Fillmore, Stevens, Marshall, St. Louis, Clearwater, Pine, Koochiching, Kanabec, Anoka, Washington, Rice, Ramsey, Itasca, Dakota, Mower, Hennepin, Isanti, Hubbard, Becker, Otter Tail, McLeod, Wright, Scott, Olmsted, Crow Wing, Lake, Polk, Goodhue and Kittson.

#### Eco regions in which work will take place:

Northern Forest Forest / Prairie Transition Prairie Metro / Urban Southeast Forest Southeast Forest Protect in Easement Protect in Fee Restore Enhance Pri-rity resources addressed by activity: Wetlands Prairie Forest Habitat

## **Narrative**

## **Summary of Accomplishments**

With the ML 2016 appropriation The Conservation Partners Legacy (CPL) Grant Program awarded 54 grants, 22 of these grants were the metropolitan area. Over 27,900 acres were enhanced, 5,750 acres were restored, and 200

Page 2|38

acres protected through these 54 projects. Thirty counties had CPL projects completed in them through 36 unique organizations. The average project for the ML 2016 grants was \$127,000, with few exceptions most projects were completed on time and many were under budget. Additionally, the awarded grant partners contributed over \$1.3 million in in-kind or cash match, far exceeding the 10% requirement.

## **Process & Methods**

The CPL Program fulfills MS 97a.056 Subd. 3a, directing LSOHC to establish a conservation partners' grant program, encouraging and supporting local conservation efforts. \$6,850,000 of the appropriated funds was available for grants. This is a stand alone program but depends on the support and technical advice of local land managers, habitat and acquisition specialists, and support staff.

Grant activities include: enhancement, restoration, and protection of forests, wetlands, prairies, and habitat for fish, game, and wildlife. A 10% match from non-state sources is required for all grants.

CPL staff develop a Request for Proposal and Program Manual incorporating LSOHC priorities, solicit applications, work with applicants to submit scorable applications, oversee grant selection, prepare/execute grant documents, review expenditure documentation, ensure financial integrity, make payments, monitor grant work, assist recipients with closing out agreements, and prepare required reports. CPL staff complies with the Department of Administration- Office of Grants Management policies.

#### Application process:

A Request for Proposal/Program Manual was posted on the CPL website in August 2016. Document contains all grant program information.

Applications are submitted on the online grant application system. Applicants use the mapping tool in the application to map project sites. Applications are accepted until September 2016 for round 1 of all grant cycles. Expedited Conservation Project (ECP) applications and applications for less than \$25,000 have a shorter application form. The application system accepts ECP applications until funding runs out, but is designed for 5 rounds of applications. Traditional (statewide) applications were accepted once, Metro applications were accepted twice, and ECP applications were accepted one time.

## Grant Selection Process:

CPL Grant Program Staff review applications for completeness. Technical Review Committees, selected by the Commissioner of Natural Resources, evaluate applications based on criteria below. A final score is given to all applications. Committees include representatives from the DNR, BWSR, UMN, USFWS, USFS, counties, and other local government and non-profit organizations. A final ranking committee of Directors of the DNR Divisions of Fish and Wildlife, Ecological Resources/Waters, and Forestry consider the technical review committee, division and regional DNR comments, and recommend projects and funding to the Commissioner. ECP grants are reviewed by CPL staff, using criteria established for each type of project, and make recommendations. Division of Fish and Wildlife leadership make final decisions. CPL Grant Program Staff work with grantees to complete financial reviews, grant agreements, and other paperwork. Work may not begin until grant contract is executed. Applications are evaluated on these criteria:

Amount of habitat restored, enhanced, or protected Local Support Degree of collaboration Urgency Multiple benefits Consistency with current conservation science Adjacent to protected lands Full funding of project Budget/cost effectiveness Public access for hunting and fishing Use of native plant materials Applicants' capacity to successfully complete and sustain work

#### Project Reviews and Reporting:

Grantees submit annual accomplishment reports on forms provided by CPL staff, based on LSOHC report forms. Reports account for the use of grant and match funds, and outcomes in measures of wetlands, prairies, forests, and fish, game, and wildlife habitat restored, enhanced, and protected. The report must include an evaluation of these results. A final report is required by all grantees 30 days after project completion.

#### CPL Administration Budget:

Grant administration costs total \$112,200, include salary/fringe for grants staff, direct and necessary costs, travel, supplies, and expenses. An Internal Service Level Agreement (SLA) is developed with MNIT to update/manage the online grant application system.

#### DNR Land Acquisition Costs:

Applicants are required to budget for DNR Land Acquisition costs that are necessary to support the land acquisition process for parcels to be conveyed to the DNR. These costs are billed to awarded grants on a professional services basis.

#### **DNR Technical Support:**

The Division of Fish and Wildlife provides ongoing technical guidance, helping applicants prepare grant proposals and meet requirements for working on state lands. Project development and oversight is provided by area managers and additional guidance is provided for land acquisitions.

#### Grantee Payment:

Grantees are paid on reimbursement basis, meaning payment is made to the grantee after work has been performed or materials purchased, but before the vendor is paid by the grantee. Grantees provide proof that work is completed or a purchase made to receive payment. Proof that the vendor was paid must be submitted to CPL staff before additional grant payments are made. Payment advances may be made for acquisitions with a signed purchase agreement. Partial payments are allowed. Funds are built into grants for required Legacy logo signage and forms of acknowledgement/notification including, but not limited to, local news advertisements announcing completion of grantees projects.

# How did the program address habitats of significant value for wildlife species of greatest conservation need, threatened or endangered species, and/or list targeted species?

All CPL project requests include a Natural Heritage Database Review, which addresses wildlife species of greatest conservation need, the MN County Biological Survey data, and/or rare, threatened and endangered species inventories.

# How did the program use science-based targeting that leveraged or expanded corridors and complexes, reduced fragmentation, or protected areas in the MN County Biological Survey.

The CPL program has a Technical Review Committee that reviews and evaluates projects for sound conservation science.

## **Explain Partners, Supporters, & Opposition**

CPL works with partners all over the state, including non-profit organizations and local, state, and federal units of government.

#### Exceptional challenges, expectations, failures, opportunities, or unique aspects of program

CPL is unique because the program works with over 200 organizations throughout the state. CPL also requires local investment in projects of at least 10% of the grant award.

#### What other dedicated funds may collaborate with or contribute to this program?

N/A

# What is the plan to sustain and/or maintain this work after the Outdoor Heritage Funds are expended?

Successful applicants include long term maintenance plans in their applications, which are considered greatly by the technical review committees.

## **Budget**

#### Personnel

Position	Annual FTE	Years Working	Amount Spent	Leverage	Leverage Source	Total
CPL Coordinator	1.0	1.0	\$83,200	-	-	\$83,200

#### **Direct Support Services**

# How did you determine which portions of the Direct Support Services of your shared support services is direct to this program?

DNR calculator

#### Explain any budget challenges or successes:

One parcel was not acquired because the landowner backed out of the sale, one parcel appraised significantly less than the assessed (applied for) value, and another parcel was replaced by two parcels of lesser value, all of these acquisitions resulted in partners turning back funding. A restoration project received bids far above the estimates so the organization applied directly to LOSHC/OHF for funding, and several restorations and enhancements came in under budget. The personnel costs were significantly under budget because the program was efficiently run by one DNR staff member with minimal assistance from two other staff.

Total Revenue: \$0

**Revenue Spent:** \$0

**Revenue Balance:** \$0

#### Of the money disclosed above, what are the appropriate uses of the money:

E. This is not applicable as there was no revenue generated.

Name	County	TRDS	Acres	Est Cost	Existing Protection	Description
Anoka Conservation District Martin and Typo Lake Carp Removal	Anoka	03422221	528	\$99,000	Yes	This project improved aquatic habitat in Martin and Typo Lakes and interconnected wetland habitats by removing common carp with a science-based approach that incorporates existing carp barriers, radio tracking, and population analysis to set goals and track progress. Over three years we did 4 commercial harvests at deeper Martin Lake and 16+ days of summer box netting at shallower Typo Lake to remove most carp. To guide these and future harvests we used radio tagging and tracking, age structure analysis of captured carp and identification of nursery areas. We developed a long-term, location-specific, science- based strategy, and a decision-support tool (carp population model) to sustain project benefits after the grant period. By working throughout this chain of lakes we created a connected network of habitat yielding multiple benefits to fish, wildlife and water.
Isanti Soil and Water Conservation Distrct Enhancing Rum River shore habitat with revetments	Anoka	03324231	1	\$100,000	Yes	This project is part of a multi-county effort to improve riparian habitat identified during the regional Rum River WRAPS. Water's edge habitat and erosion control is an important management need for the Rum River. Cedar tree revetments were used to enhance shore habitat and correct erosion on 1,500 linear-feet of mild to moderately eroding

						riverbank. 40 landowners expressed interest in response to outreach on 1/9th of the river corridor. Sites were selected with preference for creating contiguous habitat particularly adjacent to protected land and stabilizing riverbanks that were most likely to worsen
Minnesota Deer Hunters Association Carlos Avery Woody Cover Development	Anoka	03322220	50	\$75,000	Yes	if left untreated. Planted mixed hardwood trees on 50 acres of old fields on Carlos Avery Wildlife Management Area (CAWMA). The goal of this project was to provide a more continuous, diverse, and resiliant forest. Planting these openings connected existing forest stands and reduce edge habitat. The project area is adjacent to the Boot Lake Scientific and Natural Area (BLSNA) which contains a diverse forest community, including old growth white pine.
National Wild Turkey Federation Lamprey Pass Deer Protection	Anoka	03222213	22	\$34,425	Yes	This area of Lamprey Pass WMA is an old field that was direct seeded to oak in 2011 and yielded good results. However, as of the summer of 2016 the majority of the seedlings only reach a height of 24" or less due to deer browse. The DNR Area Wildlife office, who manages the land, wanted to install a temporary fence in order to allow the trees time grow beyond the browse line.
MN Prairie Chicken Society Enhanced Grassland Management 2017	Becker	11943201	20,385	\$220,827	Yes	This project increased the ability of the US Fish and Wildlife Service (F&WS) to manage grasslands on Waterfowl Production Areas (WPAs) and National Wildlife Refuges (NWRs) in the prairie regions of MN. Management was primarily by prescribed (Rx) fire, and to a lesser extent mechanical/chemical treatment of woody vegetation. Grant funds were used to contract with

						the EQUAC to be a first of CC
						the F&WS to bring in staff from outside the local
						offices (detailers) and also
						to hire local personnel who
						are trained in wildland fire
						and who would work on a
						day by day basis (ADs).
						These additional fire
						personnel supplemented
						existing local F&WS fire
						personnel. Grasslands must
						be periodically disturbed
						(burned, grazed, mowed) to
						maintain their productivity.
						In the absence of regular
						disturbance, the litter layer
						builds up, woody plants
						invade, and the vegetation
						changes to a less desirable
						state with respect to plant
						species composition and
						biologic productivity.
Minnesota Sharp-tailed Grouse	Clearwater	14935219	290	\$42,364	Yes	Sharp-tailed grouse are a
Society Bemidji Area STGR				, ,		listed SGCN and their
Habitat Enhancement						habitat management is
						embedded in DNR-SWAP.
						Populations are gradually
						declining in this area due to
						quality habitat loss/natural
						degradation. This is
						occurring because
						brushland habitats are
						growing older, more dense
						and more rank and
						openland habitats (old
						fields/lowland
						meadows/upland grass) is
						being encroached upon by
						brush and trees. Sharptail
						populations have
						experienced a decline
						evidenced by spring
						dancing ground surveys
						which show a dramatic loss
						of these Leks in the past 10
						years. These brushland
						complexes suffer the same
						"plague" as the above

Гт						
						downstream passage for fish and other aquatic life. The new structure design mimics natural stream hydraulics and effectively restore connectivity and stability to the stream with minimal maintenance. This project improves biological health and stability in the stream and Big Pine Lake, it also helps protect three state listed fish species. This project helps increase the numbers of these species and other aquatic species as passage and connectivity is restored between Big Pine Lake, the Pine River, tributaries, and ultimately the Mississippi. This will greatly benefit migratory fish, mussels, and numerous aquatic organisms. The positive effects will be direct and immediate to the aquatic plant and animal communities that inhabit or utilize more than 20 miles of the river and 400 acres of Big Pine lake, essentially reversing decades of
						impacts. Over time this will also improve fisheries and
						habitat in the upper
Rollie Johnson Natural and Recreational Area Rollie Johnson Islands Restoration 3	Crow Wing	13728217	57	\$18,000	Yes	Mississippi and tributaries. The Rollie Johnson Natural and Recreational Area consists of three islands (Big Island, Little Island, and Steamboat Island) on Upper Whitefish Lake in Crow Wing County. Big Island is a 51.41 acre island, 5.75 acres belonging to the MNDNR and 45.66 acres belonging to Crow Wing County. Little Island is a 1.84 acre island belonging to the MNDNR. Steamboat Island is a 3.82 acre island belonging to the MNDNR. Designated areas of these islands are open to public camping and there is a nature walking trail on Big Island. We are attempting to restore/maintain these islands for future generations to enjoy. Most

		02722225		¢224.000	Y	quality woodlands, but also took full advantage of disturbed inclusions (historic homesteads, formerly cultivated land, etc) to create larger gaps and openings. Volunteers controlled invasive species where appropriate, conducted plant and native bee surveys, collected and sowed white oak group acorns and other native seed, and planted and tended targeted propagation pods containing select native species. A contractor to initiated the reintroduction of fire to the project area, covering approximately one third to one half of the project area.
Dakota County Parks Dakota Lake: Forest, Woodland, and Savanna	Dakota	02723235	65	\$221,000	Yes	Dakota County enhanced 65 acres of forests, woodlands and savannas located in Lebanon Hills Regional Park. Primary tasks included removing exotic woody shrubs in all of the target plant communities. Also, canopy cover was thinned in the savanna and woodland areas to stimulate native plant growth and herbaceous ground cover growth to restore conditions that will be able to carry running ground fires in the future. Once canopy and brush removal was complete, fire was reinstated as an ecosystem process. Approximately 2/3 of the site was formerly in agricultural use, so we installed seed across much of the site
Dakota County Parks Miesville Bluff Restoration Phase II	Dakota	11317225	131	\$400,000	Yes	Dakota County restored and enhanced approximately 130 acres of degraded bluffland and former crop fields to native prairie, savanna, woodland, and forest at Miesville Ravine Park Reserve (MRPR) in southeast Dakota County. The project area is on the shoulder, crest, and flat

communities.
Friends of the Mississippi River Dakota 11519216 48 \$89,369 Yes This project enhanced and
Dakota and Washington County
Restorations at three sites: Vermillion
Linear Park (VLP) and
Rosemount Wildlife
Preserve (RWP) in Dakota
County, and Camel's Hump
Park and Open Space
(CHPOS) in Washington
County. At VLP, three acres
of floodplain and terrace
forest along the Vermillion
River was enhanced
through non-native woody
species control and native
shrub and wildflower
planting, and roughly four
acres of non-native
grassland was restored and
enhanced to native prairie.
At CHPOS, 11 acres of forest
and woodland was
enhanced through non-
native shrub removal,
native shrub and
understory additions,

						seeding, and a prescribed burn. Work at VLP and CHPOS occured on extensions of areas that were previously restored with ENRTF, LSOHC and
						CPL funding, expanding the restored and enhanced areas at each site. Restoring and enhancing these new
						acres will help buffer the current restorations and decrease the amount of invasive propagules
						reaching already restored areas. At RWP, 18 acres of forest and seven acres of prairie was be enhanced by
Vermillion Diver Wetershed	Dalrata	11420225	2	¢250.220	Vac	removing non-native shrubs, adding native shrubs, and conducting prescribed burns.
Vermillion River Watershed Joint Powers Org South Creek Stream Habitat Restoration	Dakota	11420235	3	\$258,229	Yes	Restored and improved stream habitat within South Creek, a trout stream tributary to the Vermillion River. The restoration consisted of a multitude of different features that provide new and improved habitats, increase sinuosity, improve aeration, reduce stream temperatures, and stabilize eroding slopes. Those features include removing select trees that block the flow within the channel; narrowing and stabilization of the stream banks in select locations using either brush mats with boulder toes or seed with blanket; and the installation of cover boulders, rock veins, rootwads, stream barbs, backwater pools, cobble, and tree pins. Furthermore, the channel was narrowed throughout portions of the parcel, which should combine with the habitat features to improve habitat and maintain a channel
Pheasants Forever Fillmore County WMA Enhancements	Fillmore	10412206	100	\$50,000	Yes	substrate with significantly less sand and fine sediment. This project addressed the limiting factor for pheasants and other game and non-game grassland

			-			
						species- quality nesting and
						brood rearing cover. In the
						pheasant range of
						Minnesota, quality
						grassland habitat is the
						limiting factor for higher
						pheasant populations. It is
						well documented that
						wildlife responds better to
						well managed habitat.
						Brome conversion
						significantly enhanced the
						grassland complex on
						Chosen Valley WMA and
						Spring Valley WMA. Brome
						conversion occured to help
						maximize production of
						pheasant, waterfowl and
						other wildlife. Grasslands
						like these over time
						degrade naturally and
						periodic management is
						needed to keep them

						threatened plant
						communities. Red Wing's
						Memorial Park, Barn Bluff,
						and Billings-Tomfohr
						Conservation Area/Coon
						Hill hold more than 222
						acres of prairie and savanna
						that are home to many
						species of plants, insects,
						birds, and other wildlife,
						including many rare
						species. Red Wing residents
						and personnel, along with
						resource professionals from
						several conservation
						agencies, recognized the
						importance of these sites
						and the growing problem
						with invasive species.
						Partners included City of
						Red Wing, Conservation
						Corps Minnesota (CCM),
						Friends of the Bluffs,
						Audubon, Minnesota
						Department of Agriculture
						(MDA), Minnesota
						Department of Natural
						Resources (DNR), and US
						Fish and Wildlife Service
						(USFWS). Management
						$P_{2} = 0.17   29$

						plans were written and a Comprehensive Work Plan was completed. Restoration of prairie and oak savanna through invasive species management were identified as the highest priority. The restoration strategy was to conduct initial invasive species removal on management units, institute prescribed burning, and conduct
Hennepin County HCPW	Hennepin	11823210	43	\$49,609	Yes	follow-up invasive species removal as necessary. Restoration work was initiated in 2014, and initial invasive species removal was completed on 120 acres at the end of 2016. The work is highly visible and has received strong support from citizen stakeholders. The project restored three
Hennepin County HCPW Ecological Restoration	Hennepin	11823210	43	\$49,609	Yes	The project restored three habitat types that comprise approximately 48.3 acres of a 140 acre parcel owned and managed by Hennepin County and located in the City of Medina. The 43 acre project area contains remnant Southern Mesic Oak-Basswood Forest (MHs38), a complex of wetlands, a degraded restored Southern Mesic Prairie (UPs23) and other altered landscapes. A combination of mechanical, chemical, and fire treatments were used to eliminate non-native invasive species while providing growing conditions conducive to establishing native herbaceous, graminoids and tree species. Treatments were followed by seeding in the prairie and planting in the remnant forest using community specific native plants. This project restored prairie and wetlands and enhanced the
						adjacent remnant Mesic Oak- Basswood Forest (MHs38C) that is identified on the MNDNR county biological survey.

Meadows Rum River Re-						terrestrial habitat by
meander						reconnecting over a mile of
meanuer						the Rum River to its historic
						channel using natural
						channel restoration
						principals including woody
						debris and native plants. A
						shortcut in the river
						channel caused by
						anthropogenic sources
						prior to the 1950s, which
						has since grown into a
						much larger eroded
						channel, was repaired. This
						shortcut caused excessive
						sedimentation, channel
						headcutting, floodplain
						disconnection and erosion
						of adjacent MN DNR lands.
						The repair design included
						removal of aggraded
						sediment from the natural
						channel in order to activate
						the channel. Once the
						natural channel was
						activated sheer stress was
						reduced enough to put a
						plug (fill with two toe-wood
						sod mats) into the man-
						made diversion. The bank
						was revegetated with native
						plants.
Minnesota Deer Hunters	Itasca	05426215	300	\$29,893	Yes	Oak is an invaluable tree
Association Cass & Itasca Co	Tubeu	00120210	000	<i><i><b>4</b>11100000000</i></i>	100	that provides food and
Oak Enhancement						cover to wildlife in
						Minnesota. Acorns provide
						high energy food to many
						species of wildlife and is
						especialy important to
						deer,bear and turkeys.
						Mature oak trees also
						provide hollow cavities for
						wildlife dens and nest sites
						for waterfowl. However,
						oak is not shade tolerant
						and growth can be slowed
						from ompetition and
						shading from other trees.
						Timber stand improvement
						methods were done to
						enhance the growth of oak
						and also promote the
						production of acorns at an
						earlier age. Project sites are
						in mixed hardwood stands
						and have regenerating oak
						saplings or stump sprouts
						from recent timber sales. Project work enhanced,

						promoted, and increased the growth of oak within timber stands.
Ruffed Grouse Society Ruffed Grouse and Woodcock Habitat Enhancement	Itasca	14525229	1,199	\$228,073	Yes	Brushlands and openlands in forested regions of Minnesota provide critical early successional habitats for a suite of migratory and non-migratory wildlife species. Fire suppression and lack of agency funding are factors that have contributed to a backlog of brushland habitats that have not been managed to replicate a natural disturbance regime. As a result these sites have continued to mature and the physical characteristics are no longer providing the benefits to these species. Conservation organizations such as RGS, WMI, and ABC as well as agencies (USFWS, USFS, MN DNR) have cited a need for this type of management in the forested regions of the eastern united states. This project diversified age classes on state owned brushland and openlands across the forested regions of Minnesota.
Minnesota Sharp-tailed Grouse Society EC Sharp-tailed Grouse Habitat Enhancement #1	Kanabec	04122204	613	\$49,997	Yes	Sharp-tailed grouse are a listed SGCN and their habitat management is embedded in DNR-SWAP. Populations are gradually declining in this area due to quality habitat loss/natural degradation. This is occurring because brushland habitats are growing older, more dense and more rank and openland habitats (old fields/lowland meadows/upland grass) is being encroached upon by brush and trees. Sharptail populations have experienced a decline evidenced by spring dancing ground surveys which show a dramatic loss of these Leks in the past 10 years. These brushland complexes suffer the same

						"plague" as the above
						described scenario.
Minnesota Deer Hunters Association Thief Lake/Karlstad Prescribed Burning	Kittson	16346212	279	\$46,463	Yes	The Tallgrass Aspen Parklands remains one of the most intact tallgrass prairie habitats on the continent. The area contains large tracts of protected land, including over 200,000 acres of Wildlife Management Areas, managed by the Minnesota DNR. A major challenge of habitat management in the Tallgrass Aspen Parklands is brush encroachment in grasslands. Contractors provided a critical amount of staffing to participate on prescribed burns with Area staff. Many prairie parkland species will benefit from a reduction in woody species encroachment.
Minnesota Sharp-tailed Grouse Society NC Sharp-tailed Grouse Habitat Enhancement #2	Koochiching	16033212	261	\$35,000	Yes	encroachment.Sharp-tailed grouse are alisted SGCN and theirhabitat management isembedded in DNR-SWAP.Populations are graduallydeclining in this area due toquality habitat loss/naturaldegradation. These brushlandcomplexes suffer the same"plague" as the abovedescribed scenario.
The Nature Conservancy North Shore Browse Protection	Lake	05510212	1,615	\$49,931	Yes	described scenario. The transition of Northeast Minnesota forests from dominance by conifers to dominance by short lived aspen and birch has resulted in a simplification and degradation of forest habitats and diminished habitat quality for many

						Species of Greatest
						Conservation Need (SGCN)
						and other elements of
						biodiversity. This loss of
						diversity leaves our forests
						more vulnerable to stress
						from climate change,
						invasive species, and
						outbreaks of native pests
						and pathogens. This
						problem and the related
						issue of simplified age class
						distribution are two of the
						most widely recognized
						forest ecology problems in
						the nation and we have
						struggled with addressing
						both in Minnesota since the
						early 1990s. The issue of
						species diversity loss has
						been dealt with in all
						Northern Minnesota county,
						state, and federal land
						management plans since
						that time and in both
						versions of the MN Forest
						Resources Council's
						Northeast Landscape Plans
						(2003 and 2014). Through
						previous CPL and other
						funding The Nature
						Conservancy has worked
						with Lake County, St. Louis
						County, DNR, and USFS to
						-
						restore species diversity
						through tree planting, and
						follow up treatments of
						browse protection and
						release. This project
						provided additional browse
						protection treatments to
						ensure the plantings
						continue grow out of reach
						of deer and competing
						vegetation. The sites are on
						upland native plant
						communities in a variety of
						settings on public land that
						offer a diverse range of
						habitats for many SGCN.
						Most sites are along the
						North Shore of Lake
						Superior. All sites have
						been planted with tree
						species that require browse
						protection including white
						pine, white cedar, yellow
	T 1	05500000	2.004	#105 (05	X7	birch, and red oak.

						11 1
						collaborations with major
						landowners to improve
						upland forest and riparian
						habitat in Northeast
						Minnesota. To increase
						diversity, build ecological
						resilience, improve wildlife
						habitat, and help protect
						water quality, we planted
						and tended 2 million trees
						on 9000 acres of land,
						focusing on long-lived
						conifers and important
						hardwood species. Starting
						in 2010, we used CPL
						funding to plant and tend
						nearly 1 million trees on
						5000 of those acres. In
						2013, using
						complementary, private
						foundation funds, we
						initiated a climate
						adaptation tree planting
						project one of the first in
						the region to bring the
						latest climate science into
						on-the-ground restoration.
						This resulted in an
						additional 2000 acres of
						work. The net result is a
						large network of thriving
						seedlings across a diverse
						range of habitats used by
						many Species of Greatest
						Conservation Need.
						However, many of these
						seedlings are at a critical,
						-
						vulnerable stage. Without
						several more years of
						additional tending that will
						protect them from deer
						browse and release them
						from competing vegetation,
						many of these seedlings will
						not make it to the free to
						grow• sapling stage,
						putting much of the initial
						investment at risk. This
						project providedthe browse
						protection, pruning,
						additional planting, and
						release from competition
						that is necessary to ensure
						that the trees planted on
						our previous CPL sites will
						survive and become
						thriving forest trees and
						important components of
						habitat for many wildlife
						species.

Association Thief Lake/Karlstad Buckthorn Removal						invasive brush species, has been found across the Tallgrass Aspen Parkland habitat. Buckthorn has been invading the aspen stands within the WMA sites and will need to be controlled and monitored to help prevent the spread of this invasive species. Control efforts enhanced the forest understory for many wildlife species.Aaggressive treatment will set back buckthorn infestations, preventing the forest from becoming a buckthorn monoculture.
Fox Lake Conservation League, Inc. Martin County WMA Grasslands PHASE II	Martin	10331231	56	\$29,539	Yes	3 Martin County WMA's were is great need of grassland restorations. The 50 acres targeted for replacement was primarily brome grass and has little habitat value. The replacement of these grassland acres with native species will greatly impact wildlife.
Fox Lake Conservation League, Inc. Martin County WMA Tree Removal PHASE II	Martin	10129206	50	\$45,649	Yes	Encroachment of trees by shading out prairie vegetation is destroying said vegetation. Both the encroaching tree seedlings and the seed trees need to be removed to eliminate this threat to the prairie habitat. Currently the sites are dominated by diverse native prairie species. Small areas of mature trees exist on edges or in clumps within the prairie habitat. These mature trees are providing a seed source resulting in tree invasion into the prairie as scattered trees and dense patches of trees that are completely smothering out the prairie plant species. All undesirable trees and shrub species were cut and piled and deciduous tree and shrub stumps and foliage regrowth was treated on 5 Wildlife Management Areas located in Martin County.
Fox Lake Conservation League, Inc. Martin County WMA	Martin	10332229	7	\$50,000	Yes	This project restored hydrology on 2 parcels of

Wetlands PHASE II	Т					land. Tiles were disabled
						and sediment was
						excavated. Local source
						native vegetation was
						restored on all disturbed
						project areas. High quality
						wetland and riparian
						habitat was restored on
				*		approximately 14 acres.
Pheasants Forever McLeod	McLeod	11629235	95	\$44,330	Yes	The McLeod County WMA
County WMA Enhancements						Enhancements project
						enhanced 90 acres of
						permanently protected upland cover on Wildlife
						Management Areas (WMA).
						Scattered tree removal
						significantly enhanced the
						grassland complex on Penn
						WMA, Phasianus WMA, and
						Prairie Heritage WMA and
						maximized production of
						pheasant, waterfowl and
						other wildlife. In addition to
						these WMA's that suffered
						from volunteer woody
						cover invasion, this project
						also converted 8 acres of
						brome on Prieve WMA back
						to a diverse seed mixture.
						Grasslands like these over
						time degrade naturally and
						periodic enhancements are
						needed to keep them
						functioning properly. By
						enhancing these grasslands,
						we maximize past
						investments in habitat
						protection and create a
						robust structure of
						productive and more
						resilient habitat for
						waterfowl and other
		10017001	75	#146 FD0	37	grassland/wetland species.
Friends of the Hormel Nature	Mower	10317231	75	\$146,520	Yes	The Hormel Nature Center
Center Hormel Nature Center						Critical Habitat Restoration
Critical Habitat Restoration						Project built on significant habitat restoration efforts
						that the City of Austin/Friends of Hormel
						Nature Center have
						undertaken in recent years.
						Those efforts have included
						the recent purchase of over
						100 acres of land and the
						restoration of over 165
						acres of species-rich
						mesic/wet prairie to former
						crop ground. The City has
						also successfully conducted
						several pilot oak savanna
						Several phot bak savallia

					r	
RNeighbors Quarry Hill Silver Creek Urban Corridor	Olmsted	10713231	25	\$30,910	Yes	restoration projects to test which savanna restoration methods would be most effective at HNC.The project restored an additional 50 acres of species-rich mesic/wet prairie to former crop ground and conducted 25 acres of oak savanna habitat restoration. Goals of the project were to improve habitat quality for game (particularly white-tail deer, ring-neck pheasant, waterfowl, and mourning dove), as well as nongame species (including pollinators, five state-listed species known to occur at HNC and the 23 documented Species in Greatest Conservation Need). The Quarry Hill Silver Creek Urban Corridor project
						enhanced vulnerable native flora and fauna
						communities on over 300
						acres of undeveloped public
						land. Quarry Hill Park hosts
						the Quarry Hill Nature
						Center with over 80,000 visitors per year. This
						number does not include
						the many "at-large" park
						visitors consisting of City of
						Rochester residents, visitors and school children
						for passive and active
						recreation, including fishing
						in the DNR stocked pond,
						Monarch butterfly tagging, bat observation, biking and
						cross-country skiing. These
						opportunities are less than
						two miles from downtown
						Rochester. Silver Creek's
						banks lead to Silver Lake- which connects to the
						ongoing restoration on city
						park land. With the
						suppression of invasives in
						the areas described at Quarry Hill and Silver Creek
						a diversity of native species
						will return to (or expand
						within) the area as well as
						be more apparent as under- story visibility improves.
Pelican Group of Lakes	Otter Tail	13742217	1	\$305,255	Yes	An 84-year-old dam on the
			-			- ,

Improvement District Fish Lake						Pelican River near the
Dam Rock Arch Rapids Fishway						outlet of Fish Lake was
						deteriorating and unsafe
						due to exposed rebar, sheet
						pile and crumbling
						concrete. The area where
						the dam existed was a
						major draw for recreation
						including swimming, kayaking, canoeing, fishing,
						and waterfowl hunting.
						This existing dam was
						modified by installing a
						rock arch rapids fishway,
						which improved safety,
						opportunities for
						recreation, fish and wildlife
						habitat and dispersal, and
						provided a permanent fix to
						the aging dam. A rock arch
						rapids fishway is a structure that mimics
						shallow natural waterfalls
						in rivers that can be
						traversed by fish moving up
						and downstream from the
						falls. While modification of
						the dam into rock rapids
						will benefit all aquatic
						species moving along the
						river, this structure will be
						particularly usefully in
						aiding the DNR's goal of
						reintroduction of sturgeon, a fish that is native to the
						Red River basin, but has
						been absent since the mid-
						1900s.

						years. These brushland complexes suffer the same "plague" as the above
U.S. Fish and Wildlife Service Hybrid Cattail Reduction Effort	Polk	14944222	1,325	\$43,010	Yes	described scenario. Similar to many wetland habitats throughout Minnesota, the majority of wetlands within Glacial Ridge NWR have become cattail-dominated and contain minimal open water habitat or other emergent vegetation. Hydrid cattail monocultures provide very little wildlife habitat value and lead to increased levels of sediment and phosphorus accumulation within a wetland basin. Both hybrid and non-native (narrow-leaf)cattails can tolerate a wider range of environmental conditions than native (broadleaf)cattail, thereby exacerbating management issues with this highly invasive hydrophyte. Water level management is no longer a viable option for cattail reduction in most prairie wetlands. Hybrid cattail expansion in both natural and restored wetlands is THE primary wetland habitat management issue at Glacial Ridge NWR. Reducing cattail coverage in semipermanent (and to a lesser extent seasonal) wetlands to provide a 50:50 ratio of emergent vegetation to open water createf optimal habitat for the greatest diversity of migratory birds that use the Refuge. More than 1,500 acres of cattail-dominated habitat occur within wetlands that exhibit a seasonal and/or semipermanent hydroperiod and will serve as ideal sites for cattail reduction efforts on the Refuge.
U.S. Fish and Wildlife Service Woody Vegetation Reduction Effort	Polk	14944224	308	\$45,000	Yes	Glacial Ridge NWR is especially important because approximately

						5,000 acres of virgin
						(remnant) prairie and
						savanna and 12,000 acres
						of wetlands exist within the
						acquisition boundary. In
						addition, 18,000 acres of
						prairie have been restored
						(U.S. Fish and Wildlife
						Service 2005a). Within one
						mile of the Glacial Ridge
						NWR boundary lies 7,800
						acres of remnant grassland
						in a combination of private
						and public ownership. As
						such, Glacial Ridge NWR
						represents a remarkable
						opportunity to restore
						disrupted ecological
						processes, species, and
						function on a landscape
						scale. The importance of
						this is amplified, because
						tallgrass prairie and
						savanna are globally
						endangered ecosystems.
						Historically, frequent
						wildfires and the presence
						of large ungulate grazers
						mitigated the constant
						encroachment of woody
						species into this landscape.
						Today, these practices are
						replicated whenever
						possible on Glacial Ridge
						NWR but limitations exist
						on the number of acres that
						can be treated annually.
						This problem is further
						exacerbated by the
						fragmented nature and
						terrain features of some
						management units that
						prohibit recurring
						management actions. In
						order to reduce the cover of
						woody at Glacial Ridge
						NWR, we needed to
						investigate and utilize
						another disturbance tool
						that is able to efficiently
						5
						cover large areas efficiently.
						Herbicide was applied
						aerially to woody

Cannon River Watershed Partnership Prairie Creek WMA, Grassland Mgmt	Rice	11119225	445	\$50,000	Yes	for this area with the common goal of turning the site back to native oak woodland and savanna. This project continued to remove exotic and invasive woody material from these natural areas, remove larger material off site, plant native herbaceous seed to promote a desirable understory and surrounding prairie, and plant additional oak seedlings. The site for this project is Prairie Creek Wildlife Management Area (WMA), a
WMA, Grassland Mgmt	Scott	11422209	4	\$24,000	Yes	Management Area (WMA), a 460 acre WMA located in Rice County containing several rare habitat types, including a large native Dry Hill Prairie of approximately 130 acres, rare Dry Hill Oak Savanna, and Maple-Basswood (Big Woods) Forest. Restoration and enhancement was continued on the project acres addressed in the 2015 CPL grant by targeting tree removal and woody encroachment management on both savanna and prairie habitats, as well as restoration of cropland within the WMA by planting native grass seed raised in the on-site nursery plots as well as grass seed and prairie flowers collected on the WMA. Control of other non-native herbaceous species was targeted as well in follow-up to the work completed under the 2015 Grant as part of a 5+ year plan to exhaust the on-site seed bank and reduce/eradicate these invasive species. Raymond Park is a
Watershed District Raymond Park Habitat Restoration Project						relatively untouched peninsula of land that stretches out between Spring Lake and a large wetland, which are connected only by a small channel. Once platted into 11 lots and planned for

						development, the land is now a park owned by the City of Prior Lake and offers a unique opportunity to restore a variety of habitats in one location. The natural beach community has been been altered by years of attempts to control the erosion at the shoreline. A history of turf grass and lawn maintenance have led to the loss of pollinator habitat previously provided by flowering forbs. The oak savanna area, once maintained by fire and grazing, has become overgrown with low- quality, weedy species. The Raymond Park Restoration Project provided a unique opportunity to restore four different habitats at one site: beach, shoreland, grassland, and oak savanna. As a public park, this restoration project also serves as a demonstration site for the public to learn more about different types of habitat restoration which could potentially be installed on their own
Three Rivers Park District Murphy Southern Savanna Woodland	Scott	11421210	200	\$353,100	Yes	property. The 200 acre Murphy Southern Savanna Woodland Project connected Murphy Hanrehan Prairie complex into a 675 acre fire management complex. The 190 acres of oak savanna and woodlands was cleared of woody invasives and dead wood. The 10 acre acorn sites created savanna in existing prairies providing a more natural transition from the woodlands to prairie. The restored Murphy Southern Savanna Woodland increased the habitat for numerous SGCN listed birds and may encourage savanna specialist, such as, Red-headed Woodpeckers.
Minnesota Deer Hunters Association Orr Area Wildlife	St. Louis	06619215	156	\$21,157	Yes	This project mowed and hand-cut vegetation in

Ononinga						
Openings						wildlife openings to improve habitat for white- tailed deer, ruffed grouse, black bear, and woodcock. These openings were being invaded by brush and tree saplings that needed to be regenerated to improve browse quality, berry production, and provide singing grounds for woodcock.
Minnesota Deer Hunters Association Tower Rock Outcrop Management	St. Louis	06214202	60	\$10,250	Yes	This project mechanically treated a number of rock outcrops located between Buckshot and Burntside Lakes, between Tower and Ely. These sites were managed with hand-cutting to set back encroaching woody vegetation and enhance browse and acorn production for deer. These sites are fire-dependant communities which have not been burned in 80-100 years. They are not viable for commercial forest management.
Minnesota Deer Hunters Association Winter Conifer Cover Establishment	St. Louis	05818205	226	\$30,750	Yes	On 625 acres of state forest land, coniferous tree species were released by hand-cutting competing vegetation. The goal was increased regeneration and growth rate of conifers, providing winter thermal cover for whitetail deer. Conifer cover provides refugia during winter, reducing stress on deer and increasing survival.Whitetail deer are often highly stressed during winter months in Northern Minnesota. They rely on coniferous tree stands for protective shelter, especially during the coldest periods. Conifer regeneration in harvested stands is often problematic as other species often out compete them during the first few years of regeneration post-harvest. Conifer dominance takes decades or centuries to establish after harvest. Releasing conifers from

						competition by removing
						adjacent vegetation is the
						fastest and surest way of
						establishing conifer stands.
						This will reduce deer herd
						thermal stress during the
						coldest period, improving herd survival rates and
						overall health. Release by hand-cutting is the surest
						way for achieving this goal
						as large equipment is not
						suitable for this practice.
Minnesota Sharp-tailed Grouse	St. Louis	05518235	287	\$49,938	Yes	Sharp-tailed grouse are a listed SGCN and their
Society NE Sharp-tailed Grouse Habitat Enhancement						habitat management is
Habitat Elinancement						embedded in DNR-SWAP.
						Populations are gradually
						declining in this area due to
						quality habitat loss/natural
						degradation. This is
						occurring because
						brushland habitats are
						growing older, more dense
						and more rank and
						openland habitats (old
						fields/lowland
						meadows/upland grass) is
						being encroached upon by
						brush and trees. Sharptail
						populations have
						experienced a decline
						evidenced by spring
						dancing ground surveys
						which show a dramatic loss
						of these Leks in the past 10
						years. These brushland
						complexes suffer the same "plague" as the above
						described scenario.
North St Louis Soil & Water	St. Louis	05820213	204	\$45,351	Yes	Winter thermal cover
Conservation District North St.	St. LOUIS	03020213	204	\$40,551	res	needed to be increased in
Louis Conifer Enhancement						primary wintering areas
Louis conner Ennancement						and as a result increase the
						winter survival of whitetail
						deer populations. There
						was a lack of adequate
						winter cover along these
						river corridors that is
						necessary for winter
						survival. The intent on
						these sites was to increase
						conifer cover by tree
						planting and release
						existing conifers present.
						This allowed for increased
						regeneration and growth
						rate of conifers, thus
						providing winter thermal cover for whitetailed deer.

						When these winter thermal
						cover habitat are adequate they reduce stress on the
						deer population and
						increase survival rates.
						These habitats are
						imperative to the survival
						of whitetailed deer in these
South St Louis Soil & Water	St. Louis	05213216	1	\$121,728	Yes	harsh winter areas. The goal of the proposed
Conservation District French	St. LOUIS	03213210	1	<i>φ</i> 121,720	165	project was threefold: 1.) to
River Headwaters AMA Fish						remove a culvert that is
Passage Project						impeding fish passage in
						the headwaters of the
						French River, a designated
						trout stream in northeast Minnesota 2.) to preserve
						the trail crossing at this
						location by replacing the
						culvert with an alternative,
						fish-friendly option (bridge)
						and 3.) to restore
						approximately 150 feet of the river channel once the
						culvert is removed. The site
						is entirely contained within
						the State-owned French
						River Headwaters Aquatic
						Management Area. The DNR
						offered to remove the
						culvert and haul away the material. The Reservoir
						Riders snowmobile club is
						donating the bridge, and
						this contribution will serve
						as the match.
Pioneer Heritage Conservation	Stevens	12145203	115	\$49,715	Yes	Many small seasonal
Trust Seasonal Wetlands Cattail Control III						wetlands end up being completely covered by
						dense invasive cattails
						making them unusable by
						migrating waterfowl. Open
						water seasonal wetlands
						are often laden with invertebrates, the
						nutritional food waterfowl
						need to refuel after a long
						migration and for egg shell
						strength.
Belwin Conservancy Valley	Washington	02820216	33	\$139,957	Yes	As part of Belwin's overall
Creek Project						management plan for Valley
						Creek, Belwin Conservancy restored a 33.5 acre parcel
						of land in the Valley Creek
						watershed that is
						permanently protected by a
						conservation easement.
						Fifteen acres on the North
						side are comprised of steep
						east and south-facing

						slopes. Eighteen and a half
						slopes. Eighteen and a half acres are across the road, directly adjacent to Valley Creek and include some gradual north-facing slopes. Valley Creek feeds directly into the St. Croix River, is one of the highest quality trout streams in the region, and has naturally reproducing populations of brook, brown and rainbow trout. Restoring these acres to native trees, shrubs and plants will improve stream quality in an important watershed district and provide a healthy habitat for birds, wildlife and pollinators.
Comfort Lake Forest Lake Watershed District Shields Lake Fish Barrier	Washington	03221215	1	\$30,600	Yes	Shields Lake is a small (30 acres), eutrophic basin in northern Washington County that drains via a channel into Forest Lake. An electric fish barrier was being operated along the channel to prevent the movement of rough fish between Forest Lake and Shields Lake. The electric fish barrier was unreliable due to its old age and failing hardware. The CLFLWD removed the electric barrier and replaced it with a passive barrier that can provide rough fish management at a lower long-term cost.
Pioneer Heritage Conservation Trust Seasonal Wetand Cattail Control IV	Wright	12124231	179	\$109,857	Yes	Many small to moderate sized wetlands end up being completely covered by dense/invasive cattails making them unusable by migrating waterfowl and shorebirds. Open water seasonal wetlands are often laden with invertebrates, the nutritional food waterfowl need to refuel after a long migration and for egg shell strength. Wild rice is an additional food vitally important to waterfowl during fall migration and provides valuable cover for refuge and protection.
